

ANVESH REDDY YERUVA

Portfolio: anveshyeruva.github.io/Profile/

Senior DevOps Engineer | Certified AWS Solutions Architect Professional & Kubernetes Administrator | Terraform | CI/CD | Cloud Native Platforms | Observability | DevSecOps

+1 (901) 656-4003 | anvesh.yeruva@gmail.com | linkedin.com/in/yar-agfrewd | Open to relocate onsite

SUMMARY

- Senior DevOps Engineer with 7+ years of experience designing, building, and operating production-grade cloud native platforms on AWS.
- AWS Solutions Architect Professional and Certified Kubernetes Administrator with strong expertise in distributed systems, Infrastructure as Code, container orchestration, CI/CD automation, and reliability engineering.
- Experienced in architecting secure, highly available AWS environments using multi-AZ design patterns, autoscaling strategies, encryption standards, IAM least privilege models, and structured observability frameworks.
- Hands-on expertise managing Kubernetes clusters including workload scheduling, RBAC enforcement, network policies, rolling upgrades, node lifecycle management, and production troubleshooting.
- Strong background in building reusable Terraform modules, enforcing drift control practices, and implementing infrastructure promotion workflows across development, staging, and production environments.
- Implemented monitoring and alerting strategies using CloudWatch dashboards, log analysis, and incident response practices to reduce downtime and improve system reliability.
- Collaborative engineering partner with a strong focus on operational excellence, controlled change management, automation-driven delivery, and building scalable platforms that enable teams to deploy reliably at scale.

PROFESSIONAL EXPERIENCE

DevOps Engineer (Contract) | Charter Communications - Remote (US) | Aug 2025 - Present

- Designed and implemented AWS infrastructure using Terraform including VPC networking, IAM policies, EC2 compute, S3 storage, load balancing, autoscaling groups, and secure subnet segmentation to support stable production workloads.
- Applied multi-AZ architecture patterns and secure networking strategies to improve availability, fault isolation, and controlled connectivity between services.
- Maintained and enhanced CI/CD pipelines using Jenkins and GitHub Actions, enforcing structured deployment stages, automated validations, and controlled release workflows.
- Automated infrastructure validation, operational checks, and deployment support tasks using Python and Bash to reduce manual effort and improve consistency of recurring processes.
- Supported Linux system administration across Ubuntu and RedHat environments including performance troubleshooting, service validation, and system health monitoring during infrastructure changes.

- Improved production visibility by implementing CloudWatch dashboards and refined alerting strategies, reducing detection time during infrastructure incidents.
- Contributed to patching cycles, vulnerability remediation activities, and access governance reviews aligned to internal security standards and operational risk reduction practices.
- Authored and maintained runbooks and standard operating procedures to support repeatable operational workflows and ensure consistent incident response across teams.

Senior DevOps Engineer | Kwalee - Bengaluru, India | Feb 2022 - Jul 2023

- Owned reliability of production AWS and Kubernetes environments by partnering with engineering teams to ensure stable releases, controlled change management, and consistent operational practices.
- Designed and supported secure AWS networking architectures including VPC segmentation, private subnets, NAT gateways, route tables, security groups, and Route 53 configurations to enforce controlled connectivity patterns.
- Implemented and maintained CloudTrail logging and encryption standards using KMS to support audit readiness, access governance, and traceability aligned to NIST 800 53 and FedRAMP style compliance expectations.
- Standardized infrastructure provisioning using Terraform modules and remote state practices to reduce drift, enforce consistency, and support repeatable environment recreation across development and production stages.
- Built and enhanced CI/CD workflows using Jenkins and GitHub Actions, implementing structured deployment stages, validation gates, and rollback strategies to reduce deployment risk.
- Operated Kubernetes clusters including workload scheduling, namespace isolation, RBAC policy enforcement, and resource management using requests and limits to maintain workload stability.
- Supported rolling deployments, cluster upgrade planning, node lifecycle management, and deployment rollback strategies to minimize downtime during platform changes.
- Troubleshoot pod scheduling issues, readiness and liveness probe failures, resource contention, and networking misconfigurations in distributed environments.
- Implemented Kubernetes networking patterns including services, ingress configuration, DNS resolution, and controlled traffic routing across workloads.
- Improved incident detection time by enhancing CloudWatch dashboards and reducing alert noise, leading to faster incident response during production events.
- Tuned alert thresholds and reduced noisy notifications to improve on-call effectiveness and ensure alerts reflect actionable system risk.
- Automated infrastructure validations and operational checks using Python and Bash to reduce manual intervention and improve consistency of recurring processes.
- Authored operational documentation, deployment runbooks, and response procedures to ensure consistent incident handling and knowledge sharing across teams.

Senior DevOps Engineer | Side Inc - Hyderabad, India | Aug 2016 - Feb 2022

- Designed and enhanced CI/CD pipelines using Jenkins and GitHub Actions, implementing structured build stages, artifact versioning, automated validations, and controlled deployment workflows across multiple environments.
- Led automation initiatives that reduced manual release steps and improved deployment consistency across multiple environments.
- Architected and implemented AWS infrastructure including VPC segmentation, subnets, route tables, IAM policies, load balancing, autoscaling groups, and storage services to support stable and scalable production workloads.

- Applied high-availability design principles using autoscaling and load distribution strategies to improve resilience and reduce single points of failure.
- Standardized infrastructure provisioning using Terraform modules and reusable patterns, reducing configuration drift and enabling predictable environment recreation across development, staging, and production.
- Created modular Terraform architectures to improve maintainability and support multi-service infrastructure deployments across teams.
- Supported containerization initiatives using Docker and contributed to early adoption of Kubernetes-based deployment models to improve consistency and support microservice architectures.
- Assisted with Kubernetes workload deployments, rollout validation, service configuration, and basic cluster troubleshooting as the organization evolved toward container orchestration platforms.
- Managed AWS container platforms including ECS and Fargate, supporting workload deployments, runtime stability, and service scaling strategies.
- Strengthened observability by implementing CloudWatch dashboards, log-based troubleshooting workflows, and structured incident triage practices to improve detection and resolution time.
- Developed Python and Bash automation scripts for environment validation, operational health checks, and routine maintenance activities to reduce manual operational overhead.
- Participated in on-call rotations, incident response coordination, and post-incident reviews, contributing to root cause documentation and reliability improvement initiatives.
- Authored runbooks, deployment checklists, and operational procedures to ensure consistent incident handling and knowledge transfer across engineering teams.

TECHNICAL SKILLS

CLOUD PLATFORMS & ARCHITECTURE	AWS: EC2, S3, VPC, IAM, Route 53, RDS, EBS, EFS, ALB, Auto Scaling, CloudWatch, CloudTrail, KMS, Systems Manager Multi-AZ architecture patterns, secure subnet segmentation, high availability design, fault isolation strategies
CONTAINERIZATION & ORCHESTRATION	Kubernetes, EKS, ECS, Docker, Helm RBAC, namespace isolation, network policies, rolling updates, node lifecycle management, resource requests and limits, cluster troubleshooting
INFRASTRUCTURE AS CODE & CONFIGURATION	Terraform including reusable modules, remote state management, drift reduction practices, environment promotion workflows, Ansible configuration management
CI/CD & AUTOMATION	Jenkins, GitHub Actions, Git, Pipeline orchestration, deployment validation gates, artifact versioning, blue-green deployment strategies, Python and Bash automation

OBSERVABILITY & RELIABILITY ENGINEERING	CloudWatch dashboards and alarms, structured log troubleshooting, incident triage, root cause analysis support, operational runbooks
SECURITY & COMPLIANCE PRACTICES	IAM least privilege models, encryption using KMS, CloudTrail traceability, patching coordination, vulnerability remediation, compliance-aligned logging practices

EDUCATION

Master of Science in Computer Information Systems
Christian Brothers University, Memphis, United States

Graduated: May 2025

Bachelor of Technology in Electronics and Communications Engineering
ICFAI University, Hyderabad, India

Graduated: July 2016

CERTIFICATION

- [AWS Certified Solutions Architect – Professional](#)
- [CKA: Certified Kubernetes Administrator](#)
- [Advanced Certificate Programme in DevOps – IIIT, Bangalore](#)

PROJECTS

MLOps QA Bug Severity Classifier (GitHub: mlops-qa-bugseverity)

- Built a QA focused machine learning service that trains and evaluates a text classifier for bug severity using a structured training workflow and stored model artifacts for repeatability.
- Implemented release safety checks using unit tests and API smoke tests so model behavior and service readiness are validated consistently before promotion.
- Delivered a production style inference service using FastAPI with health and prediction endpoints, packaged as a Docker container to support consistent deployments across environments.

Flask CI CD Starter (GitHub: flask-cicd-starter)

- Built a minimal Flask service with a health endpoint to support deployment readiness checks and monitoring integration in production style environments.
- Implemented continuous integration workflows using GitHub Actions to run tests and build Docker images, ensuring every change is validated automatically.
- Used a multi stage Dockerfile to separate build dependencies from runtime layers, improving portability and deployment consistency across environments.
