SUMMARY

Senior Site Reliability and DevOps Engineer with 7 years of experience building and operating reliable production platforms and cloud-native infrastructure across AWS, Azure, and GCP environments. AWS Certified Solutions Architect – Professional and Certified Kubernetes Administrator with strong hands-on expertise in Terraform, CloudFormation, Kubernetes, containerization, Python, Bash, observability, monitoring, alerting, incident response, and infrastructure automation. Experienced in supporting compute, storage, networking, IAM, monitoring, database-backed services, and secure platform operations across multi-cloud environments. Proven track record of improving reliability through capacity planning, safe rollouts, postmortems, root cause analysis, runbooks, and durable operational improvements across development, staging, and production.

EDUCATION

Christian Brothers University, Memphis, TN
MS in Computer Information Systems

Graduation – May, 2025

WORK EXPERIENCE

Charter Communications, DevOps Engineer (Contract), Remote, US | Aug 2025 to Present

- Provisioned and managed cloud infrastructure using Terraform and CloudFormation across AWS, Azure, and GCP environments, covering compute, storage, networking, IAM, load balancing, autoscaling, and secure connectivity for reliable production workloads.
- Supported AWS services including EC2, S3, VPC, IAM, ALB, Auto Scaling, Route 53, CloudWatch, CloudTrail, KMS, Systems Manager, EKS, ECS, and Fargate for production operations, security, observability, and infrastructure reliability.
- Supported Azure services including Virtual Machines, Virtual Network, Load Balancer, Application Gateway, Azure Storage, Managed Disks, Azure Monitor, Log Analytics, Azure Active Directory, and Azure Kubernetes Service for platform operations, monitoring, secure access, and workload stability.
- Supported GCP services including Compute Engine, Virtual Private Cloud, Cloud Storage, Cloud Load Balancing, Cloud DNS, Cloud Monitoring, Cloud Logging, IAM, and Google Kubernetes Engine for production support, troubleshooting, observability, and service reliability.
- Built Python and Bash automation for environment validation, deployment checks, graceful rollouts, safe operational tasks, and recurring support workflows, reducing manual effort and improving consistency.
- Designed and maintained observability workflows using CloudWatch, Datadog, and Sentry to improve monitoring, alerting, issue detection, and production visibility across services.
- Strengthened incident response through on-call support, PagerDuty alerts, root cause analysis, postmortems, and follow-up improvements that reduced repeat issues.

- Supported incident coordination with structured runbooks, troubleshooting workflows, Incident.io processes, and operational procedures that improved response consistency.
- Refined Jenkins and GitHub Actions pipelines with validation steps, deployment controls, and rollback support to improve release safety and reduce production risk.
- Contributed to patching cycles, vulnerability remediation, access reviews, safe data access practices, and cloud security controls aligned with internal compliance expectations.
- Supported infrastructure usage reviews, build versus buy discussions, and capacity planning decisions to balance reliability, performance, and cost efficiency.
- Worked closely with engineering and operations teams to maintain reliable services and improve platform health throughout the software lifecycle.

Kwalee, Senior DevOps Engineer, Bengaluru, India | Feb 2022 to Jul 2023

- Partnered with engineering teams to improve reliability, release readiness, security, and operational resilience across AWS, Azure, and GCP based production environments.
- Designed and managed secure cloud networking across AWS VPC, Azure Virtual Network, and GCP VPC environments, supporting resilient service connectivity, segmentation, routing, and controlled access for production systems.
- Supported compute, storage, IAM, monitoring, and Kubernetes operations across AWS, Azure, and GCP platforms to maintain workload stability and platform reliability.
- Built and maintained Terraform modules and remote state patterns to improve infrastructure consistency, reduce drift, and support repeatable environment recreation across stages.
- Enhanced CI/CD workflows in Jenkins and GitHub Actions with validation gates, rollback paths, rollout controls, and deployment guardrails to reduce deployment risk and improve delivery safety.
- Operated Kubernetes environments across EKS, Azure Kubernetes Service, and Google Kubernetes Engine with namespace isolation, RBAC, resource controls, rollout planning, container lifecycle management, and node operations.
- Used observability and alerting tools including CloudWatch, Azure Monitor, Cloud Monitoring, Datadog, and Sentry to improve signal quality, reduce noise, and strengthen on-call response during production incidents.
- Supported incident response with PagerDuty alerts, structured escalation, and troubleshooting across probes, scheduling, networking, databases, and deployment behavior, followed by root cause analysis and durable operational improvements.
- Created and maintained runbooks, postmortems, and incident response procedures to standardize operational handling and improve knowledge sharing across teams.
- Supported database-backed services through infrastructure monitoring, operational checks, access controls, safe data access practices, and troubleshooting to maintain reliability and performance.
- Contributed to capacity planning, infrastructure sizing, and cost-conscious platform decisions while maintaining reliability and performance targets.

Side Inc, Senior DevOps Engineer, Hyderabad, India | Oct 2018 to Feb 2022

- Led delivery pipeline improvements in Jenkins and GitHub Actions, including artifact versioning, release validation, controlled rollouts, and safe deployment practices across development, staging, and production environments.
- Built reusable Terraform modules and infrastructure patterns that improved maintainability, reduced drift, and supported reliable operations across AWS, Azure, and GCP environments.
- Improved cloud platform reliability through enhancements to compute, networking, IAM, load balancing, autoscaling, storage, and secure service communication across multi-cloud environments.
- Managed container platforms across EKS, Azure Kubernetes Service, Google Kubernetes Engine, ECS, Fargate, Docker, and Kubernetes based environments, improving scaling behavior, runtime stability, and operational readiness for production services.
- Expanded observability through CloudWatch, Azure Monitor, Cloud Monitoring, Datadog, log-driven troubleshooting, and alerting improvements that helped speed issue detection and incident triage.
- Supported incident response and on-call processes with PagerDuty aligned practices, root cause analysis, troubleshooting coordination, postmortems, and follow-up actions to reduce recurring issues.
- Drove operational readiness through runbooks, deployment checklists, post-incident reviews, and durable improvement actions that strengthened service reliability and team response consistency.
- Collaborated with engineering teams on reliability, security, compliance, and production operations throughout the software lifecycle.
- Supported infrastructure planning, service scaling, capacity reviews, and platform optimization decisions based on workload growth and operational trends.
- Helped maintain production systems that depended on cloud databases and backend services, improving operational visibility, safe data access, and troubleshooting support.

Side Inc, DevOps Engineer | Aug 2016 to Sept 2018

- Supported CI/CD automation for build, test, and deployment workflows across development and staging environments.
- Wrote Python and Bash scripts for health checks, validation routines, recurring maintenance tasks, and operational support workflows to reduce manual effort and improve reliability.
- Supported cloud infrastructure provisioning and operational changes across AWS, Azure, and GCP services covering networking, IAM, compute, load balancing, storage, and monitoring.
- Assisted with Docker based containerization and early Kubernetes adoption through deployment validation, service configuration, and troubleshooting support across cloud platforms.
- Participated in on-call rotations and incident response efforts, contributing to root cause analysis, operational follow-up actions, and service stability improvements.
- Worked with engineering teams to support secure application delivery, platform operations, and reliable environment management.

TECHNICAL SKILLS

- Computer Languages: Python, Bash, SQL
- Tools: Terraform, AWS CloudFormation, Ansible, Kubernetes, Helm, Docker, Jenkins, GitHub Actions, Git, Datadog, Sentry, PagerDuty, Incident.io
- Cloud Platforms: AWS, Azure, GCP
- AWS Services: EC2, S3, VPC, IAM, Route 53, RDS, EBS, EFS, ALB, Auto Scaling, CloudWatch, CloudTrail, KMS, Systems Manager, EKS, ECS, Fargate
- Azure Services: Virtual Machines, Virtual Network, Load Balancer, Application Gateway, Azure Storage, Managed Disks, Azure Monitor, Log Analytics, Azure Active Directory, Azure Kubernetes Service
- GCP Services: Compute Engine, Virtual Private Cloud, Cloud Storage, Cloud Load Balancing, Cloud DNS, Cloud Monitoring, Cloud Logging, IAM, Google Kubernetes Engine
- Skills: Site Reliability Engineering, Infrastructure as Code, Infrastructure Automation, Monitoring, Alerting, Observability, Incident Response, Root Cause Analysis, Postmortems, Runbooks, CI/CD Delivery, Kubernetes Operations, Containerization, Cloud Networking, Linux System Administration, Databases, Cloud Security, IAM Least Privilege, Encryption and Key Management, Vulnerability Remediation, High Availability, Multi-AZ Architecture, Capacity Planning, Graceful Rollouts, Safe Data Access, Production Operations, Reliability Engineering, Security and Compliance, Cost Optimization

PROJECTS

MLOps QA Bug Severity Classifier (GitHub: [mlops-qa-bugseverity](#))

- Built a QA-focused machine learning service that trains and evaluates a text classifier for bug severity using a structured workflow and repeatable artifacts.
- Implemented release safety checks using unit tests and API smoke tests to validate service readiness before promotion.
- Delivered a production-style inference service using FastAPI with health and prediction endpoints, packaged in Docker for consistent deployments.

Flask CI/CD Starter (GitHub: [flask-cicd-starter](#))

- Built a minimal Flask service with a health endpoint to support deployment readiness checks and monitoring integration.
- Implemented continuous integration workflows using GitHub Actions to run tests and build Docker images on every change.
- Used a multi-stage Dockerfile to separate build dependencies from runtime layers, improving portability and deployment consistency.
